

DynaSample XpressO - Known Issues software version 2.0.0 RC10 v4

Many new new features and fixes have been included in the current software update 2.0.0 RC10.
Please read the “Update ReadMe.pdf” for details.

Please note:

If you are experiencing problems please send a clear but short email to: ingo@dynasample.com

Please do not report any issues that have been listed already. We are already working on them.
We might not respond to your emails reporting bugs unless we have additional questions.
All of your issues will be noted, though – even if you don't get an answer.

Software:

- run the update twice to update all parts of the software if updating from anything earlier than the final v 2.0!
- make sure to recall the global settings for your controller in [Utility] after updating!
- some presets are still not responding as they should or tend to produce clicks.
These presets will be addressed as soon as possible.
- Keeping the graphical patch editor opened at all the time slows down the machine tremendously.
Especially when scrolling through presets.
Please open the patch editor ONLY for editing and close it afterwards.
- The Chord-Mapper layer presets are working now and can be edited in [Edit] Chord-Mapper.
Please note that multi patches for the XPressO might have up to 6 voices.
Only 2 voices will play on the XpressO due to the hardware voice limitation of 2 voices.
Dedicated multi banks for each unit will be coming in the next update.
Please turn off voices that will try to make the XpressO play more than 2 notes at the time.
- For updating user-banks from previous software versions please use the function
“update user-bank to v2.0” on the graphical editor (top center – blue button).
This will take about 15 minutes per bank and cannot be stopped! Please be patient!
Volume adjustments for old presets might still have to be made.

It is not guaranteed that old patches will still work. If you have trouble please use a new factory preset.

Known Bugs:

~~There is a bug that number boxes and sliders change the values but do not update the graphics. FIXED!~~

- Octave transpositions that are stored to a patch might not be recalled correctly. **FIXED!**
- ~~The new voice includes two modes a “fixed” (per channel) voice mode and a “rotating” voice mode.
When switching between those two modes you might briefly experience one stuck note. **FIXED!**~~
- ~~There can still be some issues with the Chord-Mapper voice selection on some presets.~~
- Distortion is not working on Chord-Mapper patches at the moment.
- “double” is currently not working. Please turn it off on older user banks.
Then press the button “copy parameter” for copying this setting to all presets within this user-bank.
The orange “copy parameter” button is located on the top center of the graphical editor.

Please read the Update_ReadMe.pdf for information about new features and bug fixes.

Version 2.0.0 RC9 is still online in case that you have serious issues with the latest RC10 version.
